

Name _____ Period _____

Skill 25.1 Exercise 1

The table below stores all order, customer, and product information in a single table, which results in repeated data.

order_id	customer_id	customer_name	customer_address	product_id	product_name	product_price	quantity
101	C01	Alex Kim	123 Oak St	P10	Laptop	999.99	1
102	C01	Alex Kim	123 Oak St	P12	Mouse	25.99	2
103	C02	Jordan Lee	45 Pine Rd	P10	Laptop	999.99	1
104	C01	Alex Kim	123 Oak St	P10	Laptop	999.99	1

Identify at least two pieces of information that are repeated in the table.

How could this data be reorganized into multiple tables to reduce redundancy?

What information would belong in each table

Skill 25.2 Exercise 1

Refer to the tables below,

Customers			Products		
customer_id	customer_name	customer_address	product_id	product_name	product_price
C01	Alex Kim	123 Oak St	P10	Laptop	999.99
C02	Jordan Lee	45 Pine Rd	P12	Mouse	25.99

Orders			
order_id	customer_id	product_id	quantity
101	C01	P10	1
102	C01	P12	2
103	C02	P10	1
104	C01	P10	1

What is the name of the customer who placed order 101?

What product was ordered in order 102, and what is its price?

How many laptops were ordered in total across all orders?

Which customer has placed the most orders?

Name _____ Period _____

Skill 25.3 Exercise 1

Refer to the tables below,

Customers		
customer_id	customer_name	customer_address
C01	Alex Kim	123 Oak St
C02	Jordan Lee	45 Pine Rd

Products		
product_id	product_name	product_price
P10	Laptop	999.99
P12	Mouse	25.99

Orders			
order_id	customer_id	product_id	quantity
101	C01	P10	1
102	C01	P12	2
103	C02	P10	1
104	C01	P10	1

The following causes an error. Explain.

```
result = customers.merge(products)
```

In the space below, write code that could be used to merge all three tables. The final table should like the one below,

	order_id	customer_id	product_id	quantity	customer_name	product_name	product_price
0	101	C01	P10	1	Alex Kim	Laptop	999.99
1	102	C01	P12	2	Alex Kim	Mouse	25.99
2	103	C02	P10	1	Jordan Lee	Laptop	999.99
3	104	C01	P10	1	Alex Kim	Laptop	999.99

Write code to answer the following questions,

What products did Alex Kim order?

What is the total cost of each order
(product_price × quantity)?

Which customer spent the most money?

Name _____ Period _____

Skill 25.4 Exercise 1

Refer to the tables below,

products				orders					
	id	description	price		id	product_id	customer_id	quantity	timestamp
0	1	thing-a-ma-jig	5	0	1	3	2	1	2017-01-01
1	2	whatcha-ma-call-it	10	1	2	2	2	3	2017-01-01
2	3	doo-hickey	7	2	3	1	3	1	2017-01-01
3	4	gizmo	3	3	4	2	3	2	2016-02-01
				4	5	3	3	3	2017-02-01
				5	6	4	1	2	2017-03-01
				6	7	1	1	1	2017-02-02
				7	8	4	1	1	2017-02-02

In the space below, rename the *id* column in *products* to *product_id*, then merge the tables. Store the result in *product_orders*

Skill 25.5 Exercise 1

Refer to the tables below,

store_a		orders	
item	store_a_inventory	item	store_b_inventory
0	hammer	0	12 hammer
1	screwdriver	1	15 nails
2	nails	2	200 saw
3	screws	3	350 duct tape
4	saw	4	6 pvc pipe
5	duct tape	5	150 rake
6	wrench	6	12 shovel
7	pvc pipe	7	54 wooden dowels

Merge the store a and store b inventories with an inner merge.

What data is missing?

Name _____ Period _____

Merge the store a and store b inventories with an outer merge.

Which values are nan or None?

Skill 25.6 Exercise 1

An ice cream parlor and a bakery have decided to merge. The bakery's menu is stored in the DataFrame bakery, and the ice cream parlor's menu is stored in DataFrame ice_cream.

bakery			ice_cream		
	item	price		item	price
0	cookie	2.5	0	scoop of chocolate ice cream	3.0
1	brownie	3.5	1	scoop of vanilla ice cream	2.95
2	slice of cake	4.75	2	scoop of strawberry ice cream	3.05
3	slice of cheesecake	4.75	3	scoop of cookie dough ice cream	3.25
4	slice of pie	5.0			

Create their new menu by concatenating the two DataFrames into a DataFrame called menu.

Explain the difference between merge and concatenate as it applies to DataFrames.
